

Final Exam

Program: Computer Science / Software Engineering
Course Name: Concepts of Programming Languages
Course Code: CS317 / SCS317
Instructor(s): Dr. Amin Allam

Date: 16/3/2021
Duration: 2 hours
Total Marks: 60 marks

تعليمات هامة:

- حيازة التليفون المحمول مفتوحا داخل لجنة الامتحان يعتبر حالة غش تستوجب العقاب وإذا كان ضروري الدخول بالمحمول فيوضع مغلقا في الحقيبة.
- لا يسمح بدخول سماعة الأذن أو البلوتوث.
- لا يسمح بدخول أي كتب أو ملازم أو أوراق داخل اللجنة والمخالفة تعتبر حالة غش.

- Exam consists of 60 multiple-choice questions in 7 pages. Each question weights 1 mark.
- Record in the bubble sheet exactly ONE answer for each question.

Qa ⇒ For questions 1 to 7, consider the following BNF grammar:

$\langle \text{expr} \rangle \rightarrow \langle \text{term} \rangle \% \langle \text{expr} \rangle \mid \langle \text{term} \rangle$
 $\langle \text{term} \rangle \rightarrow \langle \text{term} \rangle \# \langle \text{var} \rangle \mid \langle \text{var} \rangle$
 $\langle \text{var} \rangle \rightarrow x \mid y \mid z$

1 The above BNF grammar is:

- ☐ A unambiguous ☐ B left associative ☐ C right associative ☐ D orthogonal ☐ E semantics

2 The % operator in the above BNF grammar is:

- ☐ A unambiguous ☐ B left associative ☐ C right associative ☐ D orthogonal ☐ E semantics

3 The % operator in $x\#y\%z$ according to the above BNF grammar is applied to:

- ☐ A y and z ☐ B x and y ☐ C x and z ☐ D $x\#y$ and z ☐ E cannot be determined

4 The # operator in $x\#y\%z$ according to the above BNF grammar is applied to:

- ☐ A y and z ☐ B x and y ☐ C x and z ☐ D x and $y\%z$ ☐ E cannot be determined

5 In the above BNF grammar, y is:

- ☐ A right associative ☐ B terminal ☐ C nonterminal ☐ D metasymbol ☐ E low precedence

6 The highest precedence operator in the above BNF grammar is:

- ☐ A \rightarrow ☐ B % ☐ C # ☐ D | ☐ E several operators have equal highest precedence

7 The second line of the above BNF grammar can be replaced in an EBNF grammar with

$\langle \text{term} \rangle \rightarrow \langle \text{var} \rangle \{ \# \langle \text{var} \rangle \}$ which is equivalent except for:

- ☐ A orthogonality ☐ B precedence ☐ C associativity ☐ D efficiency ☐ E terminality

Qb 8 In an EBNF grammar having the rule $\langle \text{expr} \rangle \rightarrow \langle \text{term} \rangle \{ (+|-) [*] (-|*) \langle \text{term} \rangle \}$, $\langle \text{expr} \rangle$ can be expanded to:

- ☐ A $\langle \text{term} \rangle ** \langle \text{term} \rangle$ ☐ B $\langle \text{term} \rangle - + \langle \text{term} \rangle$ ☐ C $\langle \text{term} \rangle -- \langle \text{term} \rangle$
☐ D $\langle \text{term} \rangle ++ \langle \text{term} \rangle$ ☐ E $\langle \text{term} \rangle + \langle \text{term} \rangle * \langle \text{term} \rangle$

9 In an attribute grammar, the syntax rule $\langle \text{expr} \rangle [1] \rightarrow \langle \text{term} \rangle \% \langle \text{expr} \rangle [2]$ and the attribute computation function $\langle \text{expr} \rangle [1].\text{type} \leftarrow \langle \text{term} \rangle.\text{type}$ mean that:

☐ A % operator can be applied to all types ☒ B types of LHS and RHS of % operator must match

☐ C there is an array of two expressions ☒ D type of LHS expression is assigned to type of RHS term

☐ E all expression types in the program are the same

10 In an attribute grammar, the syntax rule $\langle \text{expr} \rangle [1] \rightarrow \langle \text{term} \rangle \% \langle \text{expr} \rangle [2]$ and the predicate $\langle \text{expr} \rangle [2].\text{type} == \langle \text{term} \rangle.\text{type}$ mean that:

☐ A % operator can be applied to all types ☒ B types of LHS and RHS of % operator must match

☐ C there is an array of two expressions ☒ D type of LHS expression is assigned to type of RHS term

☐ E all expression types in the program are the same

Qc \Rightarrow For questions 11 to 19, consider the following C++ program:

```

1 int t=8;
2 void F(int& r){r=5;}
3 int main()
4 {
5     int a=5, b=6; float c=1.2, d=2.9;
6     int x=a+t; float y=c+d; float z=a+c;
7     int* s=new int; F(*s); delete s;
8     return 0;
9 }

```

11 The following variable is static:

☐ A r ☒ B t ☐ C x ☐ D s ☐ E no static variable exists

12 The following line is related to orthogonality:

☐ A 2 ☐ B 5 ☒ C 6 ☐ D 7 ☐ E no such line exists

13 The following line is related to dynamic type binding:

☐ A 1 ☐ B 2 ☒ C 6 ☐ D 7 ☐ E no such line exists

14 The following variable is heap-dynamic:

☐ A r ☐ B t ☐ C s ☒ D the unnamed variable created by new ☐ E no such variable exists

15 The following variable is an alias to another variable:

☐ A r ☐ B t ☒ C y ☐ D the unnamed variable created by new ☐ E no such variable exists

16 Line 2 checks for types at:

☐ A compile time ☒ B load time ☐ C run time ☐ D exception time ☐ E no check

17 The following line contains coercion:

☐ A 1 ☐ B 2 ☒ C 6 ☐ D 7 ☐ E no such line exists

18 The following line causes a side effect:

☐ A 1 ☒ B 2 ☐ C 5 ☐ D 6 ☐ E no such line exists

19 The following line contains static value binding:

☒ A 1 ☐ B 2 ☐ C 5 ☐ D 1 and 5 ☐ E none of the previous choices

- Qd 20 One keyword with two different meanings mainly reduces:
☒ A readability ☐ B writability ☐ C reliability ☐ D efficiency ☐ E generality
- 21 A compiler compiles a statement inside a loop:
☒ A once ☐ B twice ☐ C number of times equal to number of loop iterations
☐ D same as interpreter ☐ E zero times
- 22 Abstraction mainly improves:
☐ A readability ☒ B writability ☐ C reliability ☐ D efficiency ☐ E portability
- 23 A static variable differs from other variables because it must:
☒ A bind to storage at load time ☐ B bind to values at load time ☐ C bind to type at compile time
☐ D bind to values at run time ☐ E bind to values at compile time
- 24 If a language supports short-circuit evaluation for && (logical AND), consider (g && false):
☐ A g is evaluated ☒ B g is not evaluated ☐ C g may be evaluated ☐ D error ☐ E exception
- 25 If a language supports short-circuit evaluation for && (logical AND), consider (true && g):
☒ A g is evaluated ☐ B g is not evaluated ☐ C g may be evaluated ☐ D error ☐ E exception
- 26 Type checking achieves its maximum reliability if it is done:
☒ A at compile time ☐ B at load time ☐ C at run time ☐ D when the related function is called
☐ E immediately before an error occurs
- 27 An int* variable and an int** variable are:
☐ A compatible for name type equivalence rules ☐ B compatible for structure type equivalence rules
☐ C all previous choices ☐ D never compatible ☐ E implicitly converted for name type equivalence

Qe ⇒ For questions 28 to 30, consider the following C++ program and assume static scoping:

```
1 int t, y, z, r;
2 void main()
3 {
4     int t, y, z;
5     while(a < 10)
6     {
7         int t, y, w;
8         if(t < 5) {int t;}
9     }
10 }
```

28 Assuming static scoping, the referencing environment of Line 8 does not contain:

- ☒ A t of line 4 ☐ B y of line 7 ☐ C r ☐ D w ☐ E none of the previous choices

29 Assuming static scoping, the referencing environment of Line 5 consists exactly of:

- ☐ A t, y, z, r of line 1 ☐ B t, y, z of line 4 ☒ C t, y, z of line 4 and r ☐ D r ☐ E t, y, z of line 1

30 Assuming static scoping, the variable z of line 4 with respect to the block from line 6 to line 9 is:

- ☐ A local ☒ B nonlocal ☐ C global ☐ D invisible ☐ E not related

Qf ⇒ For questions 31 to 33, consider the following program and assume dynamic scoping:

```
0 void Sub2()
1 {
2     int w, x;
3     // Line 3
4 }
5 void Sub1()
6 {
7     int x, y;
8     // Line 8
9     Sub2();
10 }
11 void main()
12 {
13     int y, z;
14     // Line 14
15     Sub1();
16 }
```

31 Assuming dynamic scoping, the referencing environment of Line 14 contains:

- ☐ A w of line 2 ☐ B x of line 2 ☐ C x of line 7 ☐ D y of line 7 ☒ E y of line 13

32 Assuming dynamic scoping, the referencing environment of Line 8 contains:

- ☐ A w of line 2 ☐ B x of line 2 ☐ C y of line 13 ☒ D z of line 13 ☐ E none of the previous choices

33 Assuming dynamic scoping, the referencing environment of Line 3 does not contain:

- ☐ A w of line 2 ☐ B x of line 2 ☐ C y of line 7 ☒ D y of line 13 ☐ E z of line 13

Qg ⇒ For questions 34 to 41, consider the following program:

```
1 void Fun(in int a, out int b, in-out int c)
2 {
3     // Line 3
4     a=7; b=8; c=9;
5     // Line 5
6     a=a; b=b; c=c;
7 }
8
9 void main()
10 {
11     int x=2, y=3, z=4;
12     Fun(x, y, z);
13     // Line 13
14 }
```

34 When execution reaches line 3, the value of a is:

- ☐ A 0 ☐ B 2 ☐ C 7 ☐ D undefined ☐ E none of the previous choices

35 When execution reaches line 3, the value of b is:

- ☐ A 0 ☐ B 3 ☐ C 8 ☐ D undefined ☐ E none of the previous choices

36 When execution reaches line 3, the value of c is:

- ☐ A 0 ☐ B 4 ☐ C 9 ☐ D undefined ☐ E none of the previous choices

37 When execution reaches line 5, assuming pass by value-result, the value of z is:

- ☐ A 0 ☐ B 4 ☐ C 9 ☐ D undefined ☐ E none of the previous choices

38 When execution reaches line 5, assuming pass by reference, the value of z is:

- ☐ A 0 ☐ B 4 ☐ C 9 ☐ D undefined ☐ E none of the previous choices

39 When execution reaches line 13, the value of x is:

- ☐ A 0 ☐ B 2 ☐ C 7 ☐ D undefined ☐ E none of the previous choices

40 When execution reaches line 13, the value of y is:

- ☐ A 0 ☐ B 3 ☐ C 8 ☐ D undefined ☐ E none of the previous choices

41 When execution reaches line 13, the value of z is:

- ☐ A 0 ☐ B 4 ☐ C 9 ☐ D undefined ☐ E none of the previous choices

Qh ⇒ For questions 42 to 49, consider the following **Prolog** declarative program:

```
female(shelly). female(mary). female(ann).  
male(bill). male(jake). male(tom).  
father(bill, jake). father(bill, shelly). father(jake, ann).  
mother(mary, jake). mother(mary, shelly). mother(shelly, tom).  
parent(X, Y) :- father(X, Y).  
parent(X, Y) :- mother(X, Y).  
gpm(X, Z) :- parent(X, Y), parent(Y, Z), male(Z).
```

42 The output of the query: female(tom) is:

- ☐ A yes ☐ B no ☐ C female ☐ D male ☐ E none of the previous choices

43 The output of the query: male(alex) is:

- ☐ A yes ☐ B no ☐ C female ☐ D male ☐ E none of the previous choices

44 The output of the query: jake is:

- ☐ A yes ☐ B no ☐ C female ☐ D male ☐ E none of the previous choices

45 The output of the query: parent(bill, Z) is:

- ☐ A Z=bill ☐ B Z=jake ☐ C Z=shelly ☐ D Z=jake and Z=shelly
☐ E none of the previous choices

46 The output of the query: parent(Z, shelly) is:

- ☐ A Z=mary ☐ B Z=bill ☐ C Z=bill and Z=mary ☐ D no
☐ E none of the previous choices

47 The output of the query: gpm(X, Z) is:

- ☐ A X=bill, Z=tom ☐ B X=bill, Z=tom and X=bill, Z=ann
☐ C X=bill, Z=tom and X=mary, Z=tom ☐ D no ☐ E none of the previous choices

48 The output of the query: gpm(X, Z), female(X) is:

- ☐ A X=bill, Z=tom ☐ B X=mary, Z=tom
☐ C X=mary, Z=tom and X=mary, Z=ann ☐ D no ☐ E none of the previous choices

49 The output of the query: gpm(X, Z), female(Z) is:

- ☐ A X=bill, Z=ann ☐ B X=mary, Z=ann
☐ C X=bill, Z=ann and X=mary, Z=ann ☐ D no ☐ E none of the previous choices

- Q1** **50** The following item does **not** belong to activation records:
A return variable B local variables C global variables D parameter variables
E none of the previous choices
- 51** Compiler knows where to resume control after a function call terminates by storing the location in:
A local variable B global variable C automatic variable D parameter variable
E activation record instance
- 52** Recursion can be simulated using a:
A stack B queue C priority queue D tree E none of the previous choices
- 53** A variable x local to a recursive function $F()$ may have **at most** the following number of different copies stored in the run-time stack at the same time:
A 0 B 1 C 2 D 3 E none of the previous choices
- 54** If several subprograms execute simultaneously on different processors, this is called:
A physical concurrency B logical concurrency C generic programming
D cooperation synchronization E competition synchronization
- 55** If task A must wait for task B to complete some activity before task A continues, this is called:
A physical concurrency B logical concurrency C generic programming
D cooperation synchronization E competition synchronization
- 56** Monitors and semaphores differ in:
A synchronization time B the problems they target C the number of deadlocks
D location of synchronization responsibilities E none of the previous choices
- 57** The following technique has the **minimum** type-safety:
A variable parameters B function pointers C inheritance D static polymorphism
E dynamic polymorphism
- 58** Creating objects of the following classes is semantically meaningless:
A abstract classes B concrete classes C solid classes D static classes E dynamic classes
- 59** The following technique attempts to achieve generality by code generation:
A static inheritance B dynamic inheritance C static polymorphism D dynamic polymorphism
E templates
- 60** The decorator design pattern can simulate:
A static inheritance B dynamic inheritance C static polymorphism D dynamic polymorphism
E templates
