

# Overview of this lecture

- Introduction to Ontology
- Ontology Components
- Type of Ontology
- Ontology Languages

# XML: Document = labeled tree

- node = label + contents

```
<module date="...">  
  <title>...</title>  
  <lecturer>  
    <name>...</name>  
  </lecturer>  
  <weblink>...</weblink>  
  <students>...</students>  
</module>
```

- DTD (Document Type Definition)  
describe the grammar and structure of permissible XML trees

# Introduction(cont.)

## Giving Semantics to Annotations

- **Agree on language** used to define meanings
  - E.g., an ontology language
  - Flexible and extensible
    - New terms can be formed by combining existing ones
  - Meaning (semantics) of such terms is formally specified

# Introduction

## Giving Semantics to Annotations

- External agreement on meaning of annotations
  - **Agree on meaning** of a set of annotation tags
    - E.g., Dublin Core

Term Name: creator	
URI:	<a href="http://purl.org/dc/elements/1.1/creator">http://purl.org/dc/elements/1.1/creator</a>
Label:	Creator
Definition:	An entity primarily responsible for making the resource.

- Limited flexibility and extensibility
- Limited number of things can be expressed

# Ontology: Origins and History

A philosophical discipline - a branch of philosophy that deals with the nature and the organisation of reality

Science of Being (Aristotle, Metaphysics)  
Tries to answer the questions:

*What characterizes being?*  
*Eventually, what is being?*

# The origin of ontology

- The word itself comes from two Greek words:
- :ONTO: = existence or being real
- : Logia: = Science or study

# What is an ontology?

- *An ontology defines the basic terms and relations comprising the vocabulary of a topic area, as well as the rules for combining terms and relations to define extensions to the vocabulary.*

Neches, R.; Fikes, R.; Finin, T.; Gruber, T.; Patil, R.; Senator, T.; Swartout, W.R. *Enabling Technology for Knowledge Sharing*. AI Magazine. Winter 1991. 36-56

- *An ontology is an explicit specification of a conceptualization.*

Gruber, T. *A translation Approach to portable ontology specifications*. Knowledge Acquisition. Vol. 5. 1993. 199-220

# What is an ontology (ii)?

- *An ontology is a hierarchically structured set of terms for describing a domain that can be used as a skeletal foundation for a knowledge base.*

B. Swartout; R. Patil; k. Knight; T. Russ. *Toward Distributed Use of Large-Scale Ontologies*  
**Ontological Engineering**. AAAI-97 Spring Symposium Series. 1997. 138-148

- *An ontology provides the means for describing explicitly the conceptualization behind the knowledge represented in a knowledge base*

A. Bernaras; I. Laresgoiti; J. Correra. *Building and Reusing Ontologies for Electrical Network Applications* **ECAI96. 12th European conference on Artificial Intelligence**. Ed. John Wiley & Sons, Ltd. 298-302

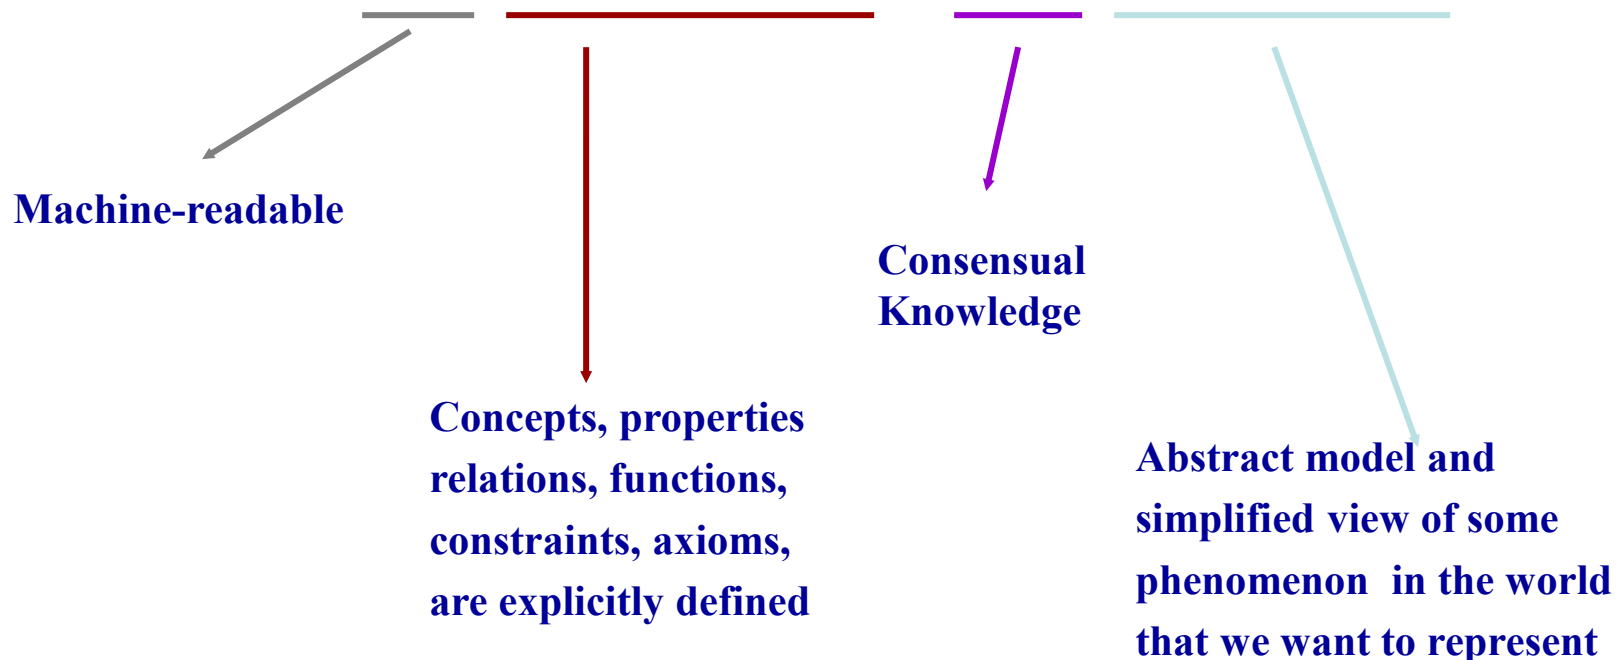

# Ontology in Computer Science

- Essentially: a way of encoding domain knowledge
- An ontology consists of:
  - A **vocabulary** used to describe some domain
  - An **explicit specification** of the **intended meaning** of the vocabulary.
- Ideally, an ontology should:
  - Capture a **shared understanding** of a domain of interest
  - Provide a **formal** and **machine understandable** model
  - An ontology describes the things we want to talk about, including both objects and relationships
- “An explicit specification of a conceptualisation” [Gruber93]

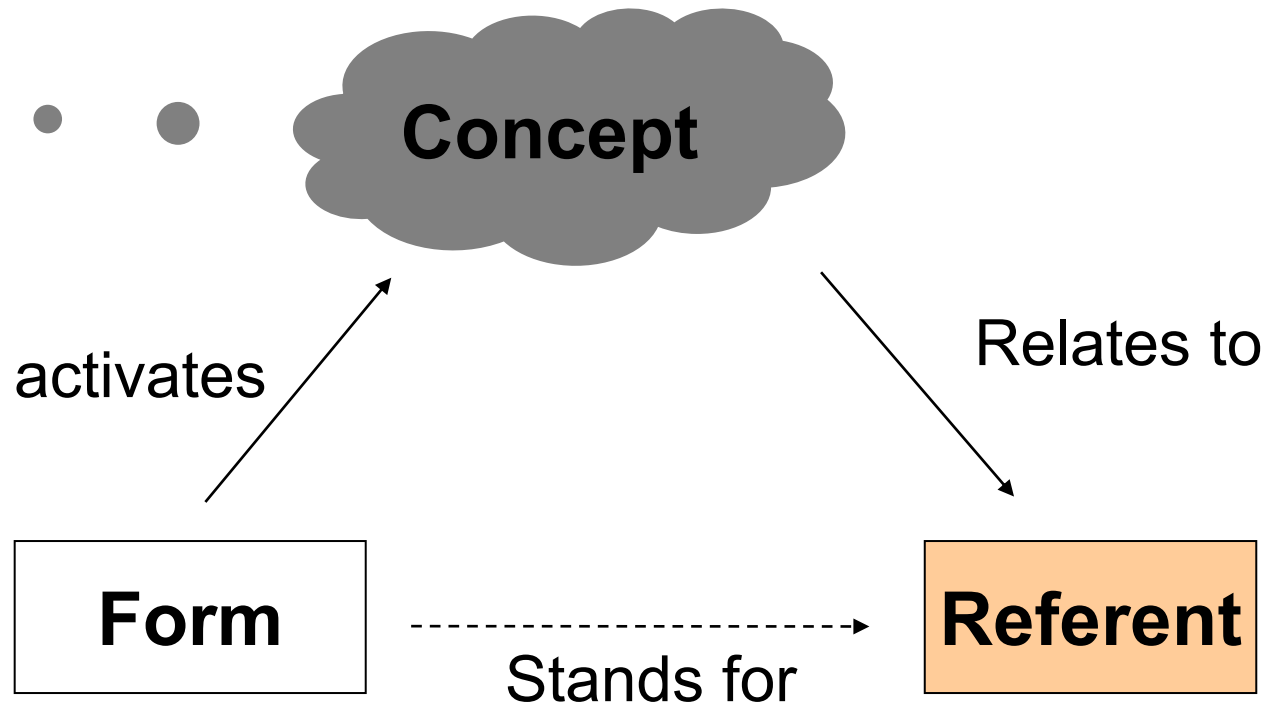

# Definitions of Ontologies

**“An ontology is a formal, explicit specification of a **shared conceptualization**”**

Studer, Benjamins, Fensel. Knowledge Engineering: Principles and Methods. *Data and Knowledge Engineering*. 25 (1998) 161-197

# Ontology in Linguistics

***“Tank”***

[Ogden, Richards, 1923]

?

**Context is  
important**

# Examples

National Institutes of Health

SUMO

# What is an ontology (ii)?

- An ontology is an explicit description of a domain:
  - concepts
  - properties and attributes of concepts
  - Relationships
  - constraints on properties and attributes
  - Individuals
- An ontology defines
  - a common vocabulary
  - a shared understanding

# Ontology Example

## Concept

conceptual entity of the domain

## Attribute

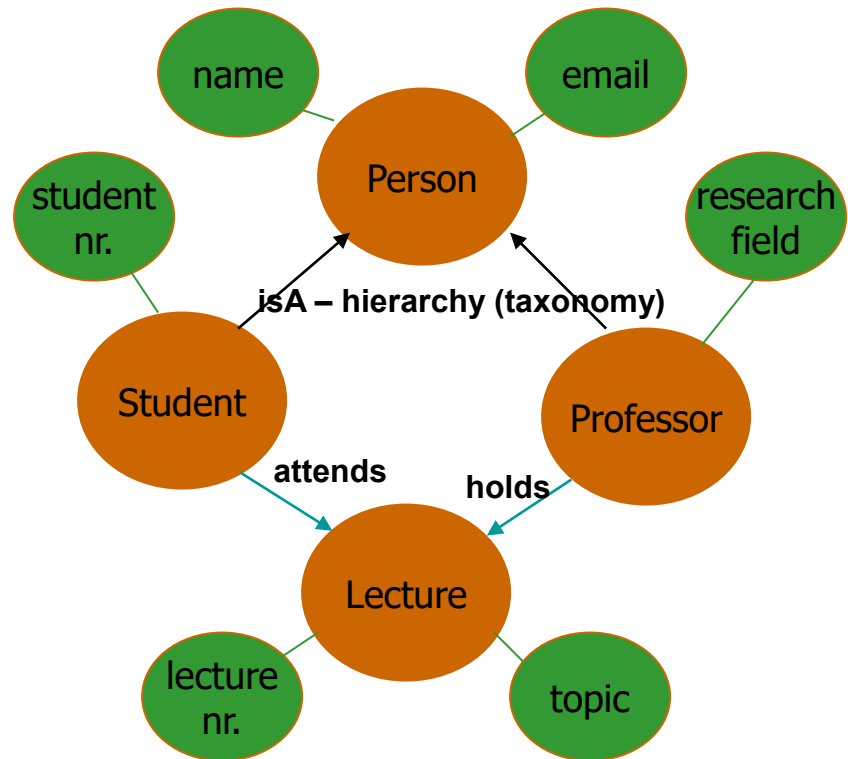

property of a concept

## Relation

relationship between concepts or properties

## Axiom (constraints)

coherent description between Concepts / Properties / Relations via logical expressions

$\text{holds}(\text{Professor}, \text{Lecture}) \Rightarrow \text{Lecture.topic} \in \text{Professor.researchField}$

# Ontology Examples

- Taxonomies on the Web
  - Yahoo! Categories
  - [Google Directory](#), [Google scholar](#), [Google Recipes](#)
- Catalogs for on-line shopping
  - Amazon.com product catalog
- Domain-specific standard terminology
  - SNOMED Clinical Terms – terminology for clinical medicine
  - UNSPSC - terminology for products and services

# Domain standard terminology

- **Unified Medical Language System (UMLS)**
  - UMLS integrates and distributes key terminology, classification and coding standards, and associated resources
  - Promote creation of more effective and interoperable biomedical information systems and services, including electronic health records
- **(Medical Subject Headings) Mesh Largest Medical Library**
- **Broad general ontologies**
  - Wordnet

# Ontology Examples

# Dublin Core

- A set of **fifteen basic properties** for describing generalised Web resources;
- ISO Standard 15836-2003 (February 2003) and ANSI/NISO Z39.85-2012 (February 2013) :  
[http://www.niso.org/apps/group\\_public/download.php/10256/Z39-85-2012\\_dublin\\_core.pdf](http://www.niso.org/apps/group_public/download.php/10256/Z39-85-2012_dublin_core.pdf)

The Dublin Core Metadata Initiative is an open forum engaged in the development of interoperable online metadata standards that support a broad range of purposes and business models.

**Dublin Core Metadata Element Set, Version 1.1**

**Identifier:** <http://dublincore.org/documents/2012/06/14/dces/>  
**Replaces:** <http://dublincore.org/documents/2010/10/11/dces/>  
**Latest version:** <http://dublincore.org/documents/dces/>  
**Date Issued:** 2012-06-14

The diagram illustrates the Dublin Core Metadata Initiative process. It shows a central stack of books labeled 'CONTRIBUTED METADATA'. To the left, various sources contribute content: 'People and organisations contribute content' (Community, Government, Education, Commercial, Multimedia), 'Images', 'Documents', 'Web pages', and 'Multimedia'. A central box states 'We store information about the content and provide access'. To the right, the process continues: 'Content is easier to find, share and use' (Search Tools, Remix Content, Mashups, Other Widgets). A list of metadata elements is provided on the far right.

• Title	• Type

# Dublin Core (15 basic properties)

DC Element Name	Definition
1. Title	A name given to the resource.
2. Creator	An entity primarily responsible for making the resource.
3. Subject	The topic of the resource.
4. Description	An account of the resource.
5. Publisher	An entity responsible for making the resource available.
6. Contributor	An entity responsible for making contributions to the resource.
7. Date	A point or period of time associated with an event in the lifecycle of the resource.
8. Type	The nature or genre of the resource.
9. Format	The file format, physical medium, or dimensions of the resource.
10. Identifier	An unambiguous reference to the resource within a given context.
11. Source	A related resource from which the described resource is derived.
12. Language	A language of the resource.
13. Relation	A related resource.
14. Coverage	The spatial or temporal topic of the resource, the spatial applicability of the resource, or the jurisdiction under which the resource is relevant.
15. Rights	Information about rights held in and over the resource.

# Dublin Core Example (RDF/XML)

</rdf:RDF>

Property	Description
author	<u>Sub- class-of Person</u> Creator of the recipe.
cookTime	<u>Sub- class-of Duration</u> The time it takes to actually cook the dish in
datePublished	<u>Sub- class-of Date</u> The date the recipe was published
description	<u>Sub- class-of Text</u> A short summary describing the dish.
keywords	<u>Sub- class-of Text</u> Other terms for your recipe such as the season ("summer"), the holiday
nutrition.calories	<u>Sub- class-of Energy</u> The number of calories in each serving.
prepTime	<u>Sub- class-of Duration</u> The length of time it takes to prepare the dish
recipeCategory	The type of meal or course your recipe is about. For example: "dinner", "entree", or "dessert, snack".
recipeCuisine	The region associated with your recipe. For example, "French", "Mediterranean", or "American".
recipeIngredient	

# Why Develop an Ontology?

- To share **common understanding** of the structure of information
  - among people
  - among software agents
- To enable **reuse** of domain knowledge
  - to avoid “re-inventing the wheel”
  - to introduce standards to allow interoperability

# What to Reuse?

- Ontology libraries
  - Protégé ontology library  
([protege.stanford.edu/ontologies.html](http://protege.stanford.edu/ontologies.html))
  - DAML ontology library ([www.daml.org/ontologies](http://www.daml.org/ontologies))
  - Ontolingua ontology library  
([www.ksl.stanford.edu/software/ontolingua/](http://www.ksl.stanford.edu/software/ontolingua/))
- Upper ontologies
  - IEEE Standard Upper Ontology ([suo.ieee.org](http://suo.ieee.org))
  - Cyc ([www.cyc.com](http://www.cyc.com))

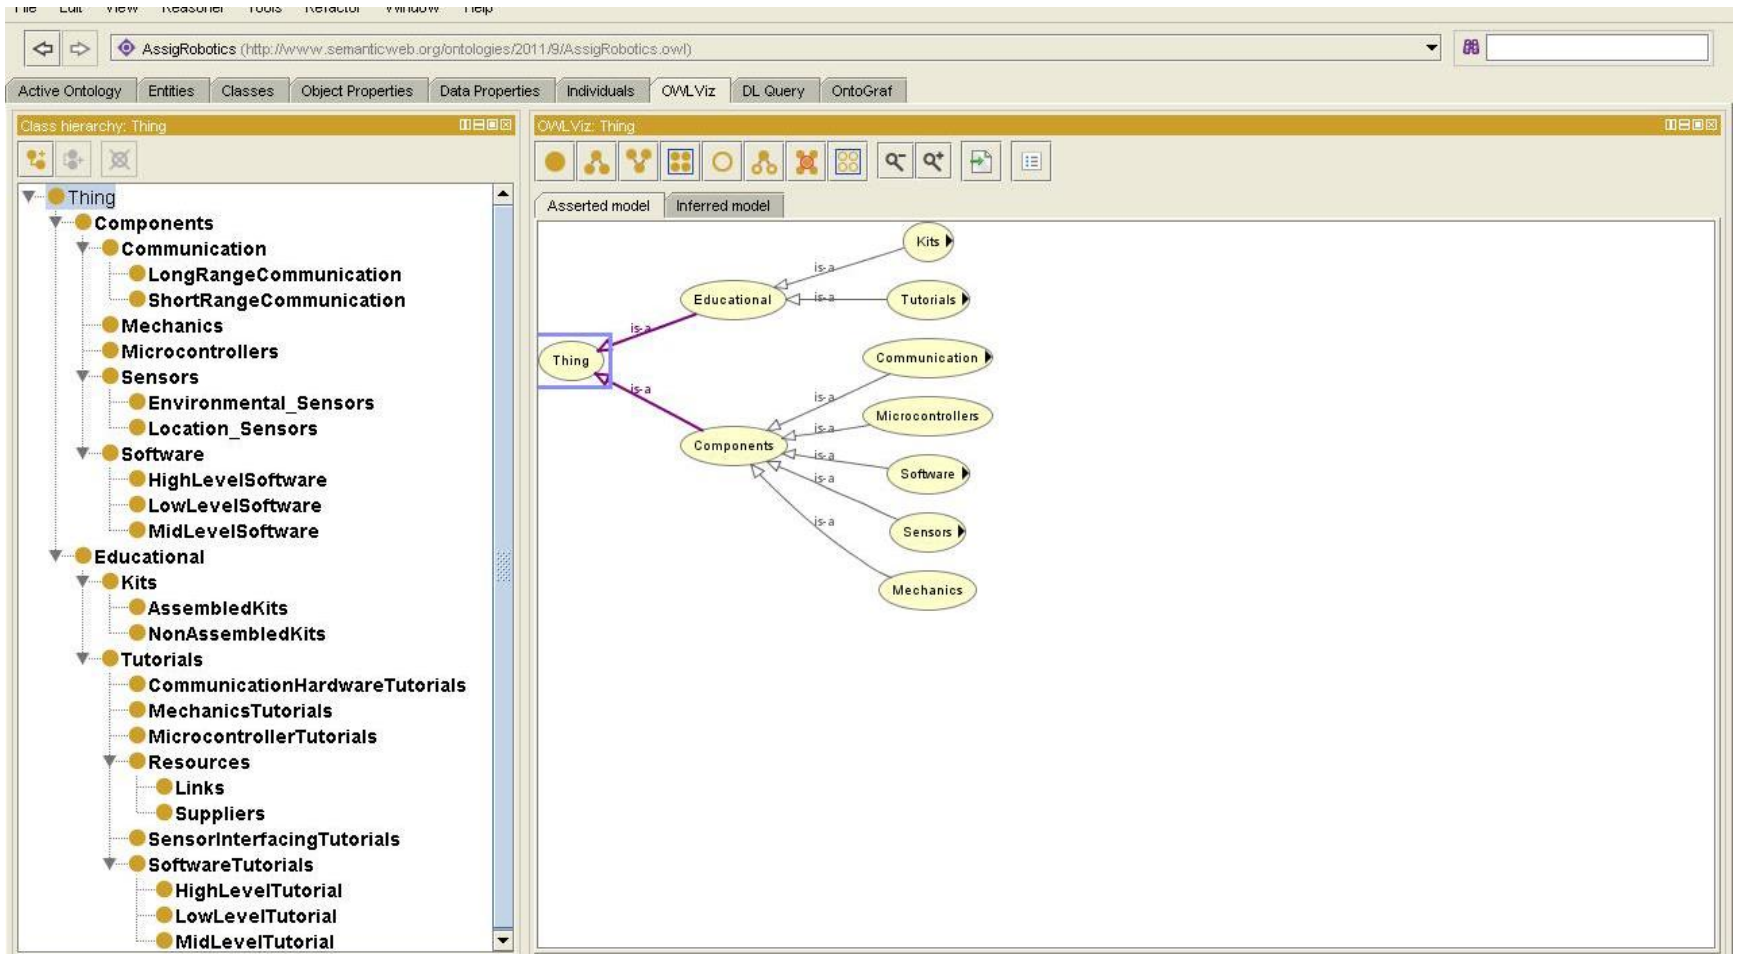

# More Reasons

- To make domain assumptions **explicit**
  - easier to change domain assumptions  
(consider a genetics knowledge base)
- To **separate** domain knowledge from the operational knowledge
  - re-use domain and operational knowledge separately

# Ontology components

- Concepts: set of entities within a domain.
- Individuals :**instances** or **objects**
  - concrete examples on concepts in a domain.
- Relations: interactions between concepts or concepts' properties (attributes, slots).
- Axioms: explicit rules to constrain the use of concepts.

# Protégé

# Ontology Languages

# Ontology Languages for the Web

- Semantic Web effort led to development of “resource description” language(s)
  - E.g., **RDF**, and later RDF Schema (**RDFS**)
- RDFS is recognisable as an ontology language
  - **Classes** and **properties**
  - **Sub/super-classes** (and properties)
  - **Range** and **domain** (of properties)
- Differences between ontology languages
  - Expressiveness
  - Computational complexity of reasoning

# Ontology Languages for the Web(cont.)

## ■ **RDF:**

- is a W3C standard, which provides tool to describe Web resources
- provides interoperability between applications that exchange machine-understandable information

## ■ **RDF Schema:**

- is a W3C standard which defines vocabulary for RDF
- organizes this vocabulary in a typed hierarchy
- capable to explicitly declare semantic relations between vocabulary terms

# RDF Statement

- ***Subject*** of an RDF statement is a resource
- ***Predicate*** of an RDF statement is a property of a resource
- ***Object*** of an RDF statement is the value of a property of a resource

# Making RDF Statements is like filling a questionnaire form

# Previous Example in RDF

- RDF Schema terms:
  - Class
  - Property (range-domain)
  - type
  - subClassOf
- These terms are the RDF Schema building blocks (constructors) used to create vocabularies:

`<Person, type, Class>`

`<hasColleague, type, Property>`

`<Professor, subClassOf, Person>`

`<Abeer, type, Professor>`

`<hasColleague, range, Person>` (What can have this property )

`<hasColleague, domain, Person>` (What can be the value of property)

# From RDFS to OWL

- Two other languages
  - **OIL**: developed by group of (largely) European researchers
  - **DAML-ONT**: developed by group of (largely) US researchers
- Efforts merged to produce **DAML+OIL**
  - Development carried out by “Joint EU/US Committee on Agent Markup Languages”
- DAML+OIL submitted to as basis for standardisation
  - Web-Ontology (**WebOnt**) Working Group formed
  - WebOnt developed **OWL** language based on DAML+OIL
  - OWL now a W3C **recommendation** (i.e., a standard)
- OIL, DAML+OIL and OWL based on **Description Logics**
  - OWL is effectively a “Web-friendly” syntax
