

Chapter 2

THE PROCESS OF INTERACTION DESIGN

Overview

What is involved in Interaction Design?

- Understanding the problem space
- Importance of involving users
- Degrees of user involvement
- What is a user-centered approach?
- Four basic activities of interaction design
- A simple lifecycle model for interaction design

Some practical issues

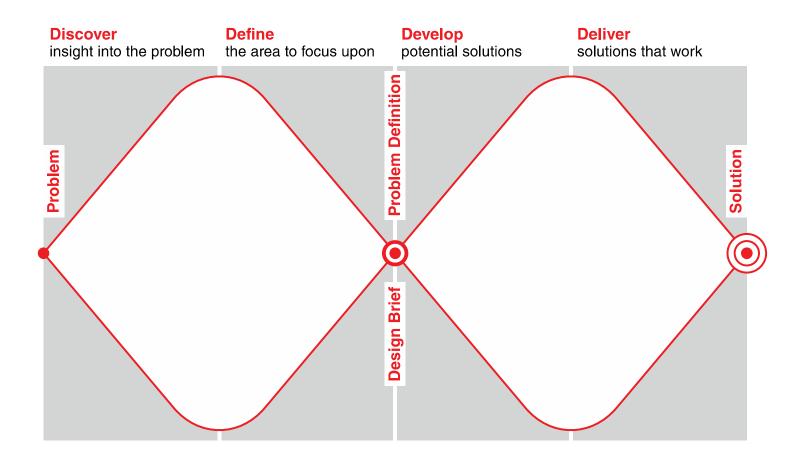

- Who are the users?
- What are the users' needs?
- How to generate alternative designs
- How to choose among alternative designs
- How to integrate interaction design activities within other lifecycle models

What is involved in Interaction Design?

- It is a process:
 - Focused on discovering requirements, designing to fulfil requirements, producing prototypes and evaluating them
 - Focused on users and their goals
 - Involves trade-offs to balance conflicting requirements
- Generating alternatives and choosing between them is key

The double diamond of design

Understanding the problem space

Explore

- What is the current user experience?
- Why is a change needed?
- How will this change improve the situation?

Articulating the problem space

- Team effort
- Explore different perspectives
- Avoid incorrect assumptions and unsupported claims

Importance of involving users

Expectation management

- Realistic expectations
- No surprises, no disappointments
- Timely training
- Communication, but no hype

Ownership

- Make the users active stakeholders
- More likely to forgive or accept problems
- Can make a big difference in acceptance and success of product

What is a user-centered approach?

User-centered approach is based on:

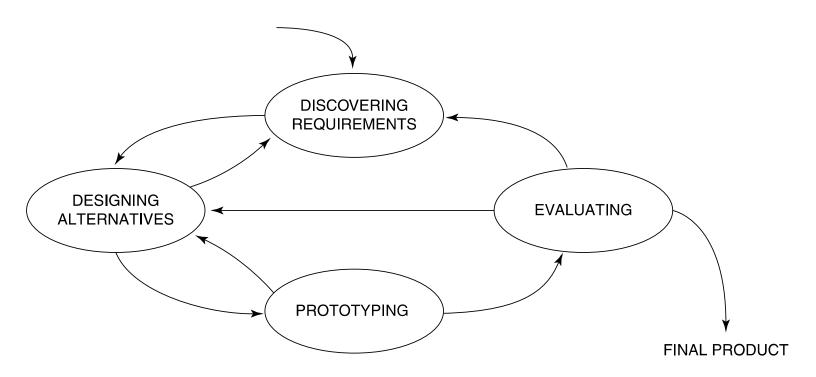

- Early focus on users and tasks: directly studying cognitive, behavioral, and attitudinal characteristics
- Empirical measurement: users' reactions and performance to scenarios, manuals, simulations, and prototypes are observed, recorded, and analyzed
- Iterative design: when problems are found in user testing, fix them and carry out more tests

Four basic activities of Interaction Design

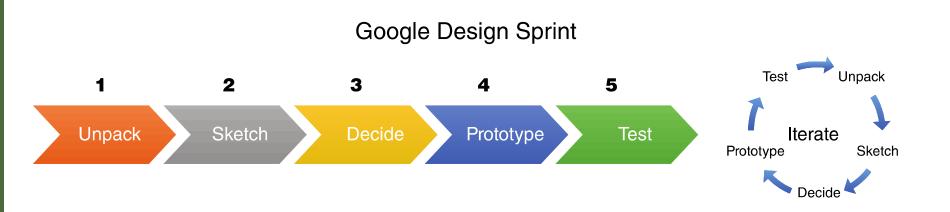

- 1. Discovering requirements
- 2. Designing alternatives
- 3. Prototyping alternative designs
- 4. Evaluating product and its user experience throughout

A simple interaction design lifecycle model

Exemplifies a user-centered design approach

Another lifecycle model: Google Design Sprints (Knapp et al., 2016)

Σουρχε: <u>Γοογλε Δεσιγν Σπριντσ</u> (υσεδ χουρτεσψ οφ Αγιλε Μαρκετινγ)

Some practical issues

- Who are the users?
- What are the users' needs?
- How to generate alternative designs?
- How to choose among alternatives?
- How to integrate interaction design activities with other lifecycle models?

Who are the users/stakeholders?

Not obvious

- 382 distinct types of users for smartphone apps (Sha Zhao et al, 2016)
- Many products are intended for use by large sections of the population, so user is "everybody"
- More targeted products are associated with specific roles

Stakeholders

- Larger than the group of direct users
- Identifying stakeholders helps identify groups to include in interaction design activities

What are the users' needs?

- Users rarely know what is possible
- Instead:
 - Explore the problem space
 - Investigate who are the users
 - Investigate user activities to see what can be improved
 - Try out ideas with potential users
- Focus on peoples' goals, usability, and user experience goals, rather than expect stakeholders to articulate requirements

13

How to generate alternatives

- Humans tend to stick with something that works
- Considering alternatives helps identify better designs
- Where do alternative designs come from?
 - 'Flair and creativity': research and synthesis
 - Cross-fertilization of ideas from different perspectives
 - Users can generate different designs
 - Product evolution based on changing use
 - Seek inspiration: similar products and domain, or different products and domain
- Balancing constraints and trade-offs

14

How to choose among alternatives

- Interaction design focuses on externally-visible and measurable behavior
- Technical feasibility
- Evaluation with users or peers
 - Prototypes not static documentation because behavior is key
- A/B Testing
 - Online method to inform choice between alternatives
 - Nontrivial to set appropriate metrics and choose user group sets
- Quality thresholds
 - Different stakeholder groups have different quality thresholds
 - Usability and user experience goals lead to relevant criteria

How to integrate interaction design activities within other models

- Integrating interaction design activities in lifecycle models from other disciplines requires careful planning
- Software development lifecycle models are prominent
- Integrating with agile software development is promising because:
 - It incorporates tight iterations
 - It supports early and regular feedback
 - It handles emergent requirements
 - It aims to strike a balance between flexibility and structure

Some key points

Four basic activities in interaction design process

- Discovering requirements
- Designing alternatives
- Prototyping
- Evaluating

User-centered design rests on three principles

- Early focus on users and tasks
- Empirical measurement using quantifiable and measurable usability criteria
- Iterative design
